Reyco Granning is happy to announce that we have made two significant changes to the 86AR/RS1035 and 86AR/3035 that will make them more cost efficient and easier to install.

As of September 2011, our 48” subframes will now come standard with air tank brackets to accommodate a jumbo tank (12” OD) with mounting holes 29.5” center-to-center. These brackets feature a forward and rearward mounting position to allow for individualized preference. Brackets are placed high enough to keep the tank out of the way while still allowing room for the tall Wabco 2S1M ABS computer. The tank brackets also contain three 1” diameter grommet holes for routing airlines and wiring if needed. With the addition of the brackets, customers will no longer need to weld on brackets and repaint before installation, thus making the slider more cost efficient by reducing labor and reducing the risk of corrosion.

Second, we have added two elongated holes to the side rail end caps to allow you to mount mud flap brackets.
